October 24, 2019

Owner: Susan Ramsey

Client: Athena, 11 yr old spayed female Beagle mix 22 lbs

ESTIMATE:

Issues:

- 1) Heart murmur grade 4 out of 6

Requires: Echocardiogram to determine heart medication needed

- 2) 2 visible Mammary tumors:

Requires: Xrays to check for lung metastases. If no metastases in lungs then surgery aims at complete tumor removal with clean histological margins by using the simplest technique. Unilateral mastectomy is currently recommended for the prevention of second tumor development associated with a regional mastectomy.

- 3) Bleeding mass on lower mandible, possible carcinoma

Requires: Tru Cut biopsy, send to pathologist

If malignant then would require complete surgical excision of the tumor, surrounding tissue, and any affected bone is required in an effort to obtain clean margins and effective local control.

- 4) Labs indicate infection and this is most likely to major periodontal disease

Requires: Full dental prophylaxis with extractions.

Laboratory diagnostics: 95

Echocardiogram: 75

True Cut Biopsy mass lower mandible: 175

Histopathology: 97

Surgical excision of the mandible tumor 115

Xrays of lungs: 75

Complete surgical excision of the mammary tumors 275

Dental prophylaxis with extractions 125

Total Estimate: not including heart medications which are to be determined. 1032
